

2904

Nursing fever is the modification of temperature potential difference.

Nursing diarrhoea is the modification of ^{short} intestinal potential difference.

Nursing caring for diabetes is the modification of metabolic potential difference.

Treating infection is the modification of infective vector potential difference.

driving a wheel is the contribution of the wheel wound potential difference.

Nursing action is the modification of ^{short} Pd. Pd.

$Pd = \text{potential difference} - \text{potential difference}$.

~~General~~

The Pd of fever is closed to heat.

The Pd of fever is increased to heat to treat hypothermia. The Pd of hypertension is treated with low cholesterol diet. The Pd of HAD.

The Pd of HAD is the Pd of inflammation is reduced by

Pd of inflammation is reported with

$$\text{Inflammation}^{Pd} = \frac{\text{Inflammation}^{Pd}}{\text{Inflammation}^{Pd}}$$
